

OVERVIEW

The ST5484E is a self-contained seismic velocity transmitter that incorporates a piezoelectric accelerometer, signal integrator, RMS peak detector, and a 4-20 mA signal conditioner into a single package. It can be mounted directly on a machine case or bearing housing without intervening signal conditioning equipment. The amplitude of the integrated acceleration (velocity) signal is converted to a proportional 4-20 mA signal compatible with industrial process control instrumentation such as PLCs, DCSs, and SCADA systems that can provide trending and/or alarming capabilities for a simplified vibration monitoring strategy.

When the flying lead or terminal block connector options are chosen, the transmitter does not need a separate environmental housing and can directly accept conduit. To reduce installed cost, it can be used with barriers for intrinsically safe installations, or wired directly to explosion-proof conduit fittings for explosion-proof, or with increased safety installations.

Need A Local Display?

When continuous, local indication of vibration levels is required at the transmitter, the Metrix ST5491E provides these capabilities.

Its sensing and transmitter elements are similar to the ST5484E, but it includes a convenient 2½ digit LCD display in an integral conduit elbow and is rated for use in temperatures from -10°C to +70°C. Refer to Metrix datasheet 1004598 for ordering information and detailed specifications.

APPLICATIONS

A vibration transmitter may be appropriate in applications where a stand-alone monitoring system may not be warranted.

The ST5484E handles general-purpose vibration measurements on a wide range of rotating and reciprocating machinery with rotational speeds between 120- and 6,000-rpm. Seismic measurements are suitable for machines with rolling-element bearings because shaft vibration in such machines is usually transmitted directly through the bearing to the bearing housing without substantial damping or attenuation. Seismic transducers can also measure vibration that does not originate at the shaft, such as bearing-related wear and defects, footing/foundation problems, piping resonances that are coupled to the machine, etc.

Why Measure Velocity?

Acceleration and displacement levels are heavily influenced by the frequencies at which the vibration is occurring, while velocity levels are much less influenced. Thus, although acceleration,

Flying Leads

(Option D=0, 1, 5, or 6) (2-wire shown; 4-wire also available)

2-Pin Terminal Block

(Option D=2)

4-Pin Terminal Block

(Option D=3)

2-Pin MIL Connector

(Option D=4)

Explosion Proof or Increased Safety Versions with Option D≠4

Note: Units sold with an explosion proof rating will include a conduit elbow:

8200-000-IEC for ATEX/UKEX/IECEx/INMETRO/
KOSHA/EAC/NEPSI

8200-000 for NRTL

Note: Increased safety with option D=4 does not require an elbow.

velocity, and displacement measurements are inter-related mathematically, seismic velocity measurements tend to be more consistent over a wide range of frequencies than either displacement or acceleration. Consequently, broadband (sometimes called “overall” or “unfiltered”) velocity measurements are appropriate for monitoring many machines as a reliable indicator of damaging vibratory energy, with the notable exception of machines with fluid-film bearings, which are usually better addressed by shaft-observing proximity probes.

Casing displacement is not a practical measurement to make directly and is typically just an integrated seismic velocity measurement. As such, the primary decision when selecting a seismic sensor will usually be whether to measure casing velocity or casing acceleration. As noted above, casing velocity will often be more appropriate because it tends to be a more reliable indicator of damaging vibratory energy over a broad frequency spectrum for low- to medium-speed machinery.

NOTE: For machines with fluid-film bearings, shaft-observing proximity probes will provide more effective vibration measurements than seismic transducers due to the rotor dynamics of the machine and the attenuation of vibratory energy through a fluid-film boundary. Accordingly, Metrix recommends and provides proximity probes and associated 4-20 mA transmitters or monitoring systems for such applications.

For machines with rolling element bearings and running above 6,000 rpm, and/or where impulsive casing vibration occurs, acceleration may be a better measurement. In such situations, it is recommended that you consult with a Metrix sales professional who can review your application and assist with selection of the proper transducer type and associated transmitter or monitoring system.

FEATURES

- **RFI/EMI Immunity** – Enhanced circuit design and installation techniques aggressively filter out noise from common sources such as handheld radios
- **Excellent Moisture Resistance** – The 2-pin MIL connector version is hermetically sealed to provide an IP67-rated enclosure. Flying lead and terminal block versions are fully potted and rated to IP66 when installed with optional IEC conduit elbow
- **Hazardous Area Approvals** – North American (NRTL), Brazilian (INMETRO), European (ATEX & IEC), and United Kingdom (UKEX) approvals available
- **Dynamic Signal Availability** – 2-wire versions provide a 4-20 mA velocity- proportional signal for easy connection to PLCs, DCSs, and other plant control systems. Optional 4-wire versions¹ also provide the raw acceleration signal (100 mV/g) for use with vibration data collectors and analyzers
- **Variety of Connection Options** – Flying leads, terminal block, and MIL-type connectors available
- **Conduit-Ready²** – Terminal block and flying lead options have conduit threads on top of sensor. No special housings are required for connection of conduit
- **Rugged, Industrial Design** – Robust construction offers outstanding durability; built-in base and housing strain protection helps ensure that over-torqueing sensor-to- machine and sensor-to-conduit connections won't damage internals or body
- **High- and Low-Pass Filter Options** – The ST5484E can be ordered with a wide variety of low- and high-pass filter options to precisely tailor the band over which vibration is measured
- **Polarity-Independent Wiring** – Metrix patented IPT® technology allows loop power to be connected without regard to voltage polarity, reducing field wiring errors and ensuring that the raw acceleration output¹ is not phase inverted
- **Multiple Mounting Options** – Integral and removable mounting stud options available in both metric and English thread sizes; flat base mounting adapters are also available
- **Loop-Powered** – Runs on nominal 24 V_{DC} power supplied by the 4-20 mA current loop
- **Wide Supply Voltage Range** – Accepts loop power voltages from 11 to 29.6 V_{DC} (intrinsically safe) or 30.0 V_{DC} (explosion proof & non-incendive)

ST5484E Seismic Velocity 4-20 mA Transmitter

Datasheet

- **RMS Amplitude Detection** – Measures Root Mean Square (RMS) vibration amplitude. Options available for True RMS or scaled RMS (RMS x √2) for “derived peak”
- **Numerous Full Scale Ranges** – The full scale ranges provided in option AAA reflect frequently-ordered ranges; however, many others (too numerous to list) are also available. Consult factory for applications requiring other full scale ranges

Notes:

1. Dynamic raw acceleration signal available with 4-wire versions only (ordering options D= 1 and D=3).
2. Metrix recommends flexible (rather than solid) conduit when possible. Solid conduit can introduce preload forces on the sensor and alter of the vibration response of the sensor.

SPECIFICATIONS

All specifications are at +25°C (+77°F) and +24 V_{DC} supply voltage unless otherwise noted.

Inputs	
Supply Voltage (see also note under max loop resistance)	11 – 29.6 V _{DC} (24 V _{DC} nominal) (intrinsically safe); 11 – 30 V _{DC} (24 V _{DC} nominal) (explosion proof and non-incendive); Metrix patented IPT® independent polarity diode bridge circuit allows voltage to be connected without regard to polarity
Circuit-to-Case Isolation	500 Vrms
Outputs	
4-20 mA	Proportional to velocity full scale range (4mA = 0 vibration, 20mA = full scale vibration)
Maximum 4-20 mA loop resistance	$R_L = 50 \times (V_s - 11) \Omega$ where V_s = Supply Voltage at transmitter terminals. NOTE: For every 50 Ω of resistance in the 4-20 mA loop, 1 V _{DC} above the minimum supply voltage (11 V _{DC}) must be available at the transmitter terminals. For example, 12 V _{DC} at the transmitter terminals will allow a 50 Ω loop resistance; 30 V _{DC} at the transmitter terminals will allow a 950 Ω loop resistance. For intrinsically safe applications, the use of a passive zener barrier will incur a voltage drop of approximately 8.1 volts at the barrier, and the loop supply voltage is limited to 26 V _{DC} . Thus, with passive barriers and a 26 V _{DC} supply, the maximum available voltage at the transmitter will be 17.9 V _{DC} and the corresponding maximum loop resistance will be 345 Ω.
Dynamic Signal	100 mV/g (10.2 mV / m/s ²) acceleration, filtered to same frequency band as proportional velocity (see ordering options E & F)

ST5484E Seismic Velocity 4-20 mA Transmitter

Datasheet

Dynamic Signal Output Impedance	10 kΩ NOTES: 1. The dynamic signal output is short-circuit protected by means of a 10 kΩ resistor, resulting in a relatively large output impedance. Many data collectors and analyzers have relatively low input impedances (100 kΩ or less) which will load this dynamic output and attenuate the signal by 10% or more. Refer to Table 1 for the dB and percentage attenuation for various load impedances. 2. Because the ST5484E is a loop-powered device with low operating power, the dynamic signal output requires a buffer amplifier for cable runs in excess of 16 feet (5 meters). Longer cable runs will also introduce distributed cable capacitance that acts as a low-pass filter, attenuating high-frequency signal content. In such situations, consult the factory for assistance selecting an appropriate low-capacitance cable.
Recommended Minimum Load Impedance (Zload) for Dynamic Signal Connection	500 kΩ (see also note 1 above)
Signal Processing	
Frequency Response (+/- 3dB passband)	2 Hz – 1500 Hz (standard) 2 Hz – 2000 Hz (optional)
Optional High-Pass Filter Corner	5, 10, 20, 50, 100, or 200 Hz (must be specified at time of ordering)
High-Pass Roll-Off	12 dB / octave
Optional Low-Pass Filter Corner	230, 250, 350, 450, 500, or 1000 Hz (must be specified at time of ordering)
Low-pass Roll-Off	12 dB / octave
Accuracy	± 2.5% (within passband) ± 4% (at corner frequencies)
Maximum Full Scale	5.0 in / sec (others by request)
Minimum Full Scale	0.5 in / sec (others by request)
Full Scale Range Units	<ul style="list-style-type: none"> • in / sec (standard) • mm / sec (available by request)
Amplitude Detection	True RMS detector; full scale may be ordered with True RMS units or scaled RMS (RMS x √2) for “derived peak” measurements See ordering option AAA.

Physical

Table 2 – Allowable Combinations for AAA & BB Options	
Full Scale Range AAA =	Allowable BB options (Mounting Stud Sizes)
121, 122, 123, 126, 151, 152, 153, 156	All (no restrictions)
124 and 154	00, 01, 03, 10, 11, 13
132 and 162	00, 01, 02, 03, 05, 09, 10, 11, 12, 13, 15, 19

NOTES:

- Smaller-diameter mounting studs are not able to withstand sustained ambient vibration levels above 2.0 in/sec. Consult Table 2 for allowable combinations of A and B options.
- The ST5484E uses an RMS amplitude detection circuit. Full scale ranges in peak units use scaled RMS (i.e., $RMS \times \sqrt{2}$). The “derived peak” measurements will equal true peak only under the special case of a pure sinusoid, not complex vibration signals.
- Hazardous Area Certifications are not compatible with all connection types. Consult Table 3 for allowable combinations of C & D options.
- Some approvals require intrinsic safety barriers, others require Explosion-Proof wiring practices. Refer to Table 4.
- Refer to the Accessories section of this document. Units sold with an explosion proof or increased safety rating will include an 8200-000 IEC or 8200-000 explosion proof elbow that will be affixed at the factory. For increased safety with D=4, elbow is not required.
- High- and Low-Pass filter corners for standard filters must be separated by at least one octave (low-pass frequency must be at least twice the high-pass frequency). All combinations are allowed except E = 6 and F = 4, 5, or 6. Custom filters with closer separation and/or different roll-offs may be available in some instances. Consult the factory if custom filters are required.
- For SIL approval, add an “S” prefix to the desired Hazardous Area Certification (Option C).

SAFETY INTEGRITY LEVEL

SIL is a method or measurement unit to determine the reliability of electrical, electronic and programmable systems. The purpose of the SIL certification is to measure safety system performance and the likelihood of failure. Achieving SIL certification, based on the IEC61508 Functional Safety Standard, signifies that the product has been thoroughly assessed and is a reliable electronic device ready to use across a wide range of industries.

Metrix products have been thoroughly evaluated by an independent third party agency on the basis of IEC61508 Functional Safety standards to obtain SIL certification.

ACCESSORIES - ELBOWS

Conduit elbows are used with flying leads and terminal block versions of the ST5484E transmitter. They are not compatible with MIL-connector versions of the transmitter. A variety of available configurations accommodate English and metric conduit thread sizes, hazardous area approvals, materials of construction, and IP ratings. Note that not all configurations are available with hazardous area approvals or IP ratings. Consult the ordering information below. For ST5484E's that need an explosion proof (Ex d) rating, that are utilizing flying leads, Option D=0, 1, 5, & 6, will have an attached 8200 conduit elbow and must be used with a certified junction box or other certified connection location. For ST5484E's that need an explosion proof (Ex d) rating, utilizing integral terminal block, Option D=2 & 3, no junction box is necessary. Table 4 in the datasheet relates what hazardous area (Option C) is allowed per ST5484E Connection (Option D). ST5484E sold with an explosion proof rating (Ex d) or increased safety (Ex ec) will include a 8200 explosion proof elbow and will be affixed at the factory. For increased safety (Ex ec) with D=4 (2-pin MIL connector), 8200 elbow will not be included.

Ex db IIB Gb, Ex tb IIIC IP66

- Elbow 8200-AAA-IEC is required for ST5484E installations meeting ATEX/UKEX/IECEX/INMETRO/KOSHA/EAC/NEPSI Ex d (flameproof) hazardous area certifications UL approved through manufacturer (not Metrix) for the following areas:
Class I; Div. 1 (Grps. B, C, D)
Class II; Div. 1 (Grps. E, F, G)

8200-000 IEC Reducers			
Part	Description	Material	Rating
91104-032	Reducer, 1"NPT(M) - ¾"NPT(F)	Nickle plated brass	ATEX/IECEX
91104-031	Reducer, 1"NPT(M) - ½"NPT(F)		
91104-022	Reducer, 1"NPT(M) - M20 X 1.5(F)		
91104-033	Reducer, 1"NPT(M) - M20 X 1.5(F)	316SS	ATEX / IECEX

8200-000 Reducers			
Part	Description	Material	Rating
91104-011	Reducer, 1"NPT(M) - ¾"NPT(F)	Copper-free Aluminum	NRTL
91104-015	Reducer, 1"NPT(M) - ½"NPT(F)		

	Part Number	Description
 <p>NOTE: Dielectric grease should be applied to the female pin holes of the connector (the pins will make metal to metal contact and squish a little amount of the dielectric grease out creating a nice seal with the sensor). Minimize the amount of dielectric grease on the rubber boot. If any grease gets on the rubber boot, the boot will slide off the threaded portion of the connector.</p>	8978-111-XXXX	<p>2-pin MIL Splash-Proof (IP66) Cable Assembly Used with 2-pin MIL style connector. Cable-to-sensor connection made by means of tight friction fit between cable molded boot and sensor - does not use threads. Connector is fully potted to provide IP66 seal against moisture ingress. 6.4mm (0.25") diameter polyurethane jacketed cable encapsulates a single twisted pair of conductors and shield. XXX.X = cable length in meters (example: 0035= 3.5 m) Min. cable length: 0.5m (XXXX=0005) Max. cable length: 999.5m (XXXX=9995) Note: Must be ordered in increments of 0.5m</p>
	8978-211-XXXX	<p>2-pin MIL Cable Assembly Similar to 8978-111 but without splash-proof boot and without IP66 rating; identical constraints on XXXX ordering options.</p>
	8978-200-0000	<p>2-pin MIL Connector Assembly Similar to 8978-211 but without cable (connector can be disassembled for field installation of cable)</p>
	8978-311-XXXX	<p>2-pin MIL (IP67) Cable Assembly Similar to 8978-111 but uses overmolded screw-type connector for IP67 rating. 4.9mm (0.19") diameter polyurethane jacketed cable encapsulates a single twisted pair of 20 AWG conductors and shield. Gold plated contacts, Stainless steel 316L Nut. XXX.X = cable length in meters (example: 0050= 5.0 m) NOTE: only 5m, 10m, and 20m lengths available at this time. 5m length stock std; other length may incur longer lead times.</p>
  <p>NOTE: Dielectric grease should be applied to the female pin holes of the connector (the pins will make metal to metal contact and squish a little amount of the dielectric grease out creating a nice seal with the sensor). Minimize the amount of dielectric grease on the rubber boot. If any grease gets on the rubber boot, the boot will slide off the threaded portion of the connector.</p>	<p>9334-111-XXXX-YYYY</p> <p>9334-211-XXXX-YYYY</p>	<p>2-pin MIL Splash-Proof Cable Assembly With Armor (IP66) Used with 2-pin MIL-style connector. Connector is fully potted and provided with integral molded boot to provide a seal against moisture ingress. 7.1mm (0.28") diameter 304 stainless steel armor encapsulates a single twisted pair of conductors and shield.</p> <p>2-pin MIL Armored Cable Assembly (IP66) Similar to 9334-111 but without splash-proof boot and identical constraints on XXXX and YYYY ordering options. XXX.X = armor length in meters (example: 0035= 3.5 m) Min. armor length: 0.5m Max. armor length: 60m Must be ordered in 0.5m increments YYYY.Y = cable length in meters Min. cable length: 1.0 Max: 999.5m Must be ordered in 0.5 m increments; NOTE: cable length must exceed armor length by at least 0.5 m.</p>
	8169-75-002-XXX	<p>2-wire Cable Assembly Designed for installations where conduit will not be used to protect field wiring. Fitting mates directly to all 8200 elbows with 3/4" NPT reducers. Cable is 2-conductor (20 AWG) twisted, shielded pair in PVC jacket. Cable grip included for strain relief. Material: zinc-plated steel XXX= length in feet (example: 010=10 feet) Min. cable length: 1 foot (001) Max. cable length: 999 feet (999)</p>
	8201-001	<p>Conduit Union Fits between ST5484E and 8200 conduit elbow when there is not enough room to rotate the elbow. Suitable for Class I, Div 1 (Grps A,B,C,D) and Class II, Div 1 (Grps E,F,G) hazardous areas. Material: zinc-plated steel</p>

	7084-001 Flange Mount Adapter Adapts 1/2" NPT mounting stud on ST5484E to 3-hole flat-base pattern. Hole pattern is three equally spaced 0.26" diameter holes on 1.5" diameter circle. Adapter is 2" diameter x 0.75" thick. Material: 303 stainless steel
	7084-002 Flange Mount Adapter Same as 7084-001 except center hole adapts 1/4" NPT stud on the 5484E.
	7084-005 Flange Mount Adapter Same as 7084-001 except center hole adapts 3/8 x 24 UNF stud on the 5484E.
	8253-002 1/2" NPT to 1/4" NPT Reducer Bushing Adapts 1/4" NPT stud on ST5484E (B=0) to 1/2" NPT mounting hole. Material: 303 stainless steel
	93818-004 Cable Grip Strain Relief Fitting Used primarily with 8978 cable assemblies where cable enters junction box. 3/4" NPT male thread to cable grip. Fits cable diameters from 0.156" to 0.25". Complete with sealing ring and locknut. Hot dip / mechanically galvanized finish. Suitable for NEMA 4 junction boxes.
NOTE: This cable grip can be used with the 9334 cable. 	93818-018 Cable Grip Strain Relief Fitting Similar to 93818-004, but fits larger cable diameters from 0.4" to 0.5", such as customer-supplied cables used with terminal block versions of ST5484E (D = 2 or 3).

OUTLINE DIAGRAMS

Figure 1: Outline dimensions of the ST5484E (all versions except MIL-Style Connector). Dimensions in mm [inches]. Optional* 8200-001 conduit elbow shown installed.

* **NOTE:** 8200-000-IEC elbow is mandatory for ATEX/UKEX/IECEX/INMETRO/KOSHA/EAC/NEPSI Ex d (flameproof) or Ex ec (increased safety when $D \neq 4$) approved installations. The 8200-000 elbow is mandatory for NRTL Ex d (flameproof) approved installations.

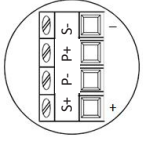

Figure 2: Outline dimensions of the ST5484E-XXX-XX4-XX (MIL-Style Connector). Dimensions in mm [inches].

WIRING CONNECTIONS

Table 5 – Wiring Connection Legend		
Connector Type	Dynamic Signal Connections	Power Connections
MIL-C-5015	Not Available	24 V _{DC} power may be connected to all ST5484E models without regard to polarity. Sensor uses IPT® independent polarity diode bridge circuit that will always orient voltage correctly inside sensor, regardless of polarity externally. NOTE: Although the ST5484E allows polarity in either direction, installations using I.S. barriers will need to observe correct polarity at the barrier input side. However, the barrier output side (i.e., sensor connection) may be wired without regard to polarity.
2-wire flying leads	Not Available	
2-wire terminal block	Not Available	
4-wire flying leads	Red: Power + (P+) Blue: Power - (P-) White: Dynamic Signal - (S-) Black: Dynamic Signal + (S+)	
4-wire terminal block		

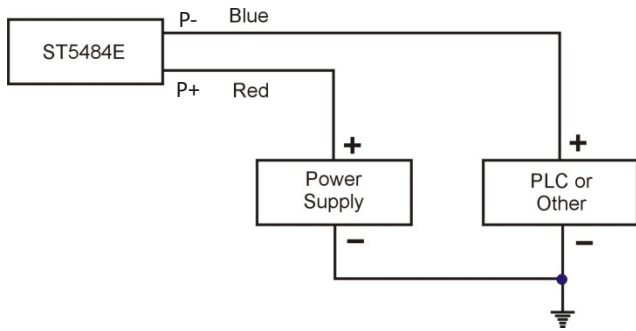

Figure 3: Typical installation for a single ST5484E seismic vibration transmitter.

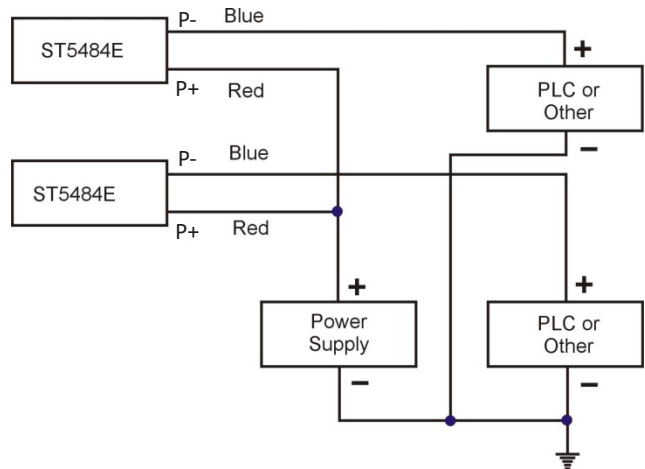

Figure 4: Typical installation for multiple ST5484E seismic vibration transmitters.
